## 1. Partial Derivative

### 1.1. Definition

In calculus, a partial derivative of a function of several variables is the derivative of the function with respect to one of the variables, with the others treated as constants. For example, if  $f(x, y)$  is a function of two variables, then the partial derivative of  $f$  with respect to  $x$  is the derivative of  $f$  with respect to  $x$  while holding  $y$  constant, and is denoted  $\frac{\partial f}{\partial x}$ .

Partial derivatives are useful in multivariable calculus, as they allow us to find the rates of change of a function with respect to each of its variables independently. They are also used in the gradient vector, which points in the direction of the greatest rate of increase of a function at a given point.

The partial derivative of a function  $f(x, y)$  with respect to  $x$  is given by:

$$\frac{\partial f}{\partial x} = \lim_{h \rightarrow 0} \frac{f(x + h, y) - f(x, y)}{h}$$

Similarly, the partial derivative of  $f$  with respect to  $y$  is given by:

$$\frac{\partial f}{\partial y} = \lim_{h \rightarrow 0} \frac{f(x, y + h) - f(x, y)}{h}$$

These expressions can be used to find the partial derivatives of a function by directly computing the limits, or by using the rules of calculus to simplify the expressions.

### 1.2. Example

To find the partial derivatives of the function  $f(x, y) = \sin x \cos y^2$ , we need to use the rules of calculus to take the derivatives with respect to  $x$  and  $y$  while holding the other variable constant.

The partial derivative of  $f$  with respect to  $x$  is given by:

$$\frac{\partial f}{\partial x} = \frac{\partial}{\partial x}(\sin x \cos y^2) = \frac{\partial}{\partial x}(\sin x) \cos y^2 + \sin x \frac{\partial}{\partial x}(\cos y^2) = \cos x \cos y^2$$

The partial derivative of  $f$  with respect to  $y$  is given by:

$$\frac{\partial f}{\partial y} = \frac{\partial}{\partial y}(\sin x \cos y^2) = \frac{\partial}{\partial y}(\sin x) \cos y^2 + \sin x \frac{\partial}{\partial y}(\cos y^2) = -2y \sin x \sin y^2$$
